## Coordinating Our Efforts: *Establishing Effective and Scientifically Sound Marine Debris Goals, Practices, and Outreach for Alaska*

Marine debris is a problem that is prevalent in all areas of coastal Alaska, affecting diverse interests such as tourism, fishing, rural subsistence, human health, fish and wildlife populations, and ecosystems. In response, marine debris programs have been formed and supported by diverse and uncentralized groups. These efforts require coordination and would benefit each other's experience. To address this a workshop will be held focused on marine debris issues in Alaska.

The workshop will begin w/an introduction to current marine debris removal efforts in the state and current knowledge about the politics, economics and science of marine debris in Alaska . After these sessions the workshop will be broken into smaller groups to address the following action items:

1. Where and how accessible are regional debris accumulations?
2. Is standardized marine debris data collection possible?
3. What to do with collected debris?
4. How can we reduce marine debris sources through education and outreach?
5. How to develop emergent programs statewide?
6. Who Cares?: Impacts and Effects of MD on habitat, fisheries, commerce, traditional use, ecosystem etc.
7. What criteria should be applied to prioritizing MD cleanups in the state?

The format for the workshop will allow for experts in these areas to present and then in the summary the focus will be on what will work for Alaska. Open discussions will be lead during the workshops in the forming of these action items for use in Alaska. At the conclusion of the two-day conference a panel will meet to compile all the gathered information and create guidelines for implementation of these action items.

### WHAT IS MARINE DEBRIS?

*Marine debris is any manufactured or man-made solid material that enters the coastal or marine environment. It may enter directly when it is lost or dumped from a ship, or indirectly when debris washes out to sea via rivers, streams, and storm drains.*

### MARINE DEBRIS SOURCES

*Sources of marine debris include land-based sources, such as littering, dumping, and industrial losses. Ocean-based debris can come from fishing vessels, cargo ships, stationary platforms, and other vessels.*

## PACIFIC

*Coordinating Our Efforts: Establishing Effective and Scientifically Sound Marine Debris Goals, Practices, and Outreach for Alaska*

### MANDATES

Mandates supporting NOAA's marine debris efforts include the following:

- Marine Debris Research, Prevention, and Reduction Act of 2006, S.362
- U.S. Ocean Action Plan
- Coral Reef Conservation Act
- Marine Plastic Pollution Research and Control Act, 33 U.S.C. §§ 1901 et seq.
- Marine Protection, Research, and Sanctuaries Act, (Title II) 33 U.S.C. §§ 1401 et seq.
- Clean Water Act, 33 U.S.C. §§ 1251 et seq.

### CURRENT PARTNERS

- Alaska Sea Grant College Program
- Marine Conservation Alliance Foundation
- NOAA Marine Debris Program

### BENEFITS OF THE PROJECT

- Proceedings volume to serve as a sourcebook for the development of Alaskan marine debris programs
- Better networking and collaboration among marine debris organizations
- Better support for emerging marine debris programs
- Identification of regional priorities for Alaska
- Standardization of data collection to allow for regional assessments of marine debris accumulation, source identification, evaluation of environmental effects

*This project is funded through NOAA's National Ocean Service, Office of Response & Restoration, Marine Debris Program. The NOAA Marine Debris Program works with other NOAA offices, as well as other federal, state, and local agencies and private sector partners to support national, state, local and international efforts to protect and conserve our nation's natural resources, oceans, and coastal waterways from the impacts of marine debris.*
